

Dear Hiring Team,

I am seeking an intellectual environment that rewards analytical rigor and precision. As a quant researcher, my role would involve extracting useful information from financial data, and refining valuation models.

I am drawn to the problem-solving required to interpret market trends, assess risk, and uncover opportunities. In my education I have become fluent in linear algebra, probability, and stochastic calculus applied to quantum theory. Physics research consists of mathematical modelling and computer simulation, as such I have experience interpreting noisy data to create predictive models of stochastic and correlated systems. I am proactive in strengthening my weaknesses, so I made sure to take classes in programming and algorithms during my MIT undergraduate. I understand that microseconds of latency makes a difference.

MIT fostered in me the values of learning while doing, detaching oneself from ego, and going farther than fast, which I see reflected in the culture of GSA. I look for clear and quick communication, and collaboration with an engaged and thoughtful team.

Sincerely,
Isabelle Rose
